

Web Accessibility Assessment & Remediation Report

Sample federal web content deliverable demonstrating Section 508/WCAG review, remediation documentation, content inventory, quality assurance, and validation practices.

Assessment ID OCIO-WEB-508-2026-001	Asset reviewed Digital Services Overview - sample page
Assessment type Content, markup, keyboard, and publishing QA	Prepared by William Ferrufino - portfolio sample
Assessment date September 2026	Status Remediation validation complete

Portfolio disclaimer: This document is an independent job-application sample. It is modeled on the structure and terminology used in publicly available DHS Section 508 testing materials, but it is not an official DHS assessment, certification, policy, or Trusted Tester report.

1. Executive Summary

The sample page was reviewed for common web accessibility, content quality, and publishing issues. The assessment combines manual inspection with code-level review. Automated tools can identify some accessibility conditions, but manual testing remains necessary to evaluate keyboard operation, meaningful structure, labels, instructions, link purpose, and content relationships.

12	4	4	0
checks completed	findings logged	findings remediated	open high-priority issues

Overall assessment

Sample disposition: Ready for publication after remediation validation. Four accessibility/content-quality findings were documented. All four were corrected and re-tested in this portfolio scenario. This disposition is illustrative and does not represent formal DHS certification.

2. Scope and Test Approach

Area reviewed	Manual validation performed
Keyboard access	Tab order, visible focus, activation of links and controls without a mouse
Page structure	Page title, landmarks, one H1, logical heading hierarchy, lists and reading order
Links and controls	Descriptive link purpose, accessible names, labels and instructions

Area reviewed	Manual validation performed
Images	Purposeful alternative text; decorative images excluded from assistive output
Forms	Visible labels, programmatic association, understandable instructions and errors
Visual presentation	Color dependence, focus visibility, responsive reflow and readable content
Content quality	Plain language, acronyms, descriptive headings, concise calls to action

Testing note: DHS public testing documentation states that accessibility tools do not evaluate every requirement and should be used with manual testing. This sample follows that principle by documenting both technical checks and human validation steps.

3. Findings and Remediation Log

ID	Finding	Priority	Remediation / corrective action	Validation	Status
A11Y-01	Form input used placeholder text without a persistent programmatic label.	High	Added a visible label and associated it to the input using matching for/id values.	Keyboard and accessibility-tree review confirmed the accessible name.	Validated
A11Y-02	Keyboard focus was difficult to identify against dark navigation.	High	Added a high-contrast focus outline with offset; no color-only state.	Keyboard-only pass confirmed focus remains visible throughout navigation.	Validated
A11Y-03	Generic link text did not describe destination when read out of context.	Medium	Replaced generic wording with descriptive destination-based link text.	Reviewed links independently from surrounding paragraph content.	Validated
A11Y-04	Card heading was visually styled but rendered as a DIV.	Medium	Changed component output to semantic H3 consistent with page hierarchy.	DOM inspection and heading-navigation review confirmed correct structure.	Validated

4. Remediation Detail

A11Y-01 - Form label

Before: The input depended on placeholder text.

Corrective action: Add a persistent visible label and programmatic association.

Example: <label for='email'>Email address</label> <input id='email' type='email'>

Validation: Confirm the label is visible, keyboard reachable with the field, and exposed as the field's accessible name.

A11Y-02 - Visible keyboard focus

Corrective action: Use a clearly visible focus treatment on links, buttons, form fields, and other interactive controls. Re-test the entire interaction path using only the keyboard.

A11Y-04 - Semantic heading structure

Before: <div class='card-title'>Accessibility resources</div>

After: <h3 class='card-title'>Accessibility resources</h3>

Validation: Inspect the DOM and navigate by headings to verify the visual and programmatic hierarchy match.

5. Quality Assurance Checklist

Check	Result	Evidence / reviewer note
Descriptive page title and one H1	Pass	Title identifies the page purpose; H1 is unique.
Logical heading hierarchy	Pass	H2/H3 structure follows content relationships.
Keyboard access and visible focus	Pass	All interactive elements reachable and focus visible.
Meaningful link purpose	Pass	Links describe destination or action.
Images and alternative text	Pass	Meaningful images have concise alternatives; decorative imagery is ignored.
Form labels and instructions	Pass	Visible labels are programmatically associated.
Color is not the only indicator	Pass	Status includes text labels in addition to visual styling.
Responsive/reflow review	Pass	Content remains readable and operable at narrow viewport widths.
Plain-language content review	Pass	Short sections, descriptive headings, active voice, limited jargon.
Production verification	Pass	Published output compared with approved staging version.

6. Content Inventory and Governance Review

The content inventory records ownership, audience need, review status, and recommended lifecycle action. This supports repeatable governance and helps identify stale, duplicative, or inaccessible content before publication.

Content item	Owner	Last review	Finding / quality note	Action
Digital services overview	Digital Services	Aug. 2026	Current, concise, accessible structure	Keep
Accessibility resources	Accessibility Program	Feb. 2025	Long paragraphs; headings are not task-based	Revise
Technology standards FAQ	Enterprise Architecture	Nov. 2024	Duplicates related policy explainer content	Merge
Legacy modernization announcement	Communications	May 2022	Outdated; no active user task	Retire
Data services overview	Data Office	Jan. 2025	Acronym-heavy; unclear next step	Revise

7. Issue Handoff and Validation Workflow

Step	Owner	Output
1. Identify	Content manager / tester	Document user impact, page/component, steps to reproduce, and evidence.
2. Triage	Content + development	Set priority; determine whether the fix is content, CMS configuration, template, or code.
3. Remediate	Assigned owner	Apply content or code correction in the non-production environment.
4. Validate	Content manager / tester	Repeat the failed check and confirm expected behavior.
5. Regression check	Project team	Verify the change did not introduce issues on related pages/components.
6. Publish & verify	Content manager	Publish approved change, verify production, record status and review date.

8. Final Disposition

Sample result	PASS - remediation validated
Open findings	0
Recommended next action	Publish after normal content-owner approval; schedule periodic content and accessibility review.
Evidence retained	Findings log, remediation notes, QA checklist, content inventory, and validation results.

Portfolio note

This sample intentionally combines the types of artifacts named in the job description - an accessibility report, remediation documentation, a content inventory, and a quality assurance checklist - into one realistic federal-style deliverable. It is designed to demonstrate process knowledge without representing formal DHS Trusted Tester certification.
